

Speed, Security, Communication, and Confidence in Implantology Treatments

NemoScan is a solution for the diagnosis and planning of implantology treatments. The implantologist, using the most advanced technology, can plan implantology treatments and show the patient how to proceed with complete safety, assurance, and confidence in a few simple steps. It is a software that shows the patient's mouth in three dimensions, so, with a clear communication, the patient can be shown how his mouth will be before and after the treatment of implantology. In addition, the software allows the clinician to generate a surgical guide that can be printed on any 3D printer.

BENEFITS

Speed

The implantologist plans the implants in less time, which saves clinical time in surgery.

Safety

There is greater predictability and accuracy of the treatment since the implantologist performs a bone and prosthetic analysis that helps him plan and simplify the treatment.

Autonomy

The software allows the implantologist to create his own surgical guides, saving laboratory costs.

Effective Communication

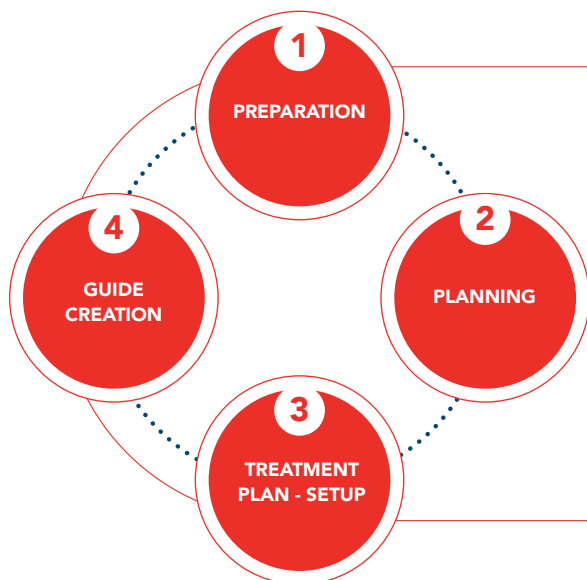

Using 3D images eases the explanation of the treatment which increases patient confidence. Thus, you can establish interactive and clear communication.

Integral

Possibility of combining and integrating orthodontics and smile design.

Processes NemoScan

COMMUNICATION WITH THE PATIENT

Preparation

1 Visualization and preparation of tomographies (TAC images).

Planning

2 Study and placement of implants.

Treatment plan - setup

Guides creation

4 Creation of Biomodels and Surgical Guides.

CHARACTERISTICS (FUNCTIONS)

NemoScan is a solution for the diagnosis and planning of implantology treatments. It works with the digital scans of the upper and lower models. It allows you to:

- Visualize the tomographies
- Repair, edit, transform, sculpt, and perform other operations with meshes
- Segment the teeth
- Use multiple implant databases
- Align different types of models to the tomography (intraoral scanner, digital wax-up)
- Plan implantation treatment
- Plan and generate customized and standardized accessories
- Generate products: occlusal splints for printing, biomodels (pre-surgical, bone, etc.) and multiple surgical guides

In addition to the tools mentioned above, one of the main advantages of working with **NemoScan** is the ability to integrate with the rest of Nemotec software.
